Articulate Localization Multi-Language Packager

User guide | Version 1.3

Purpose

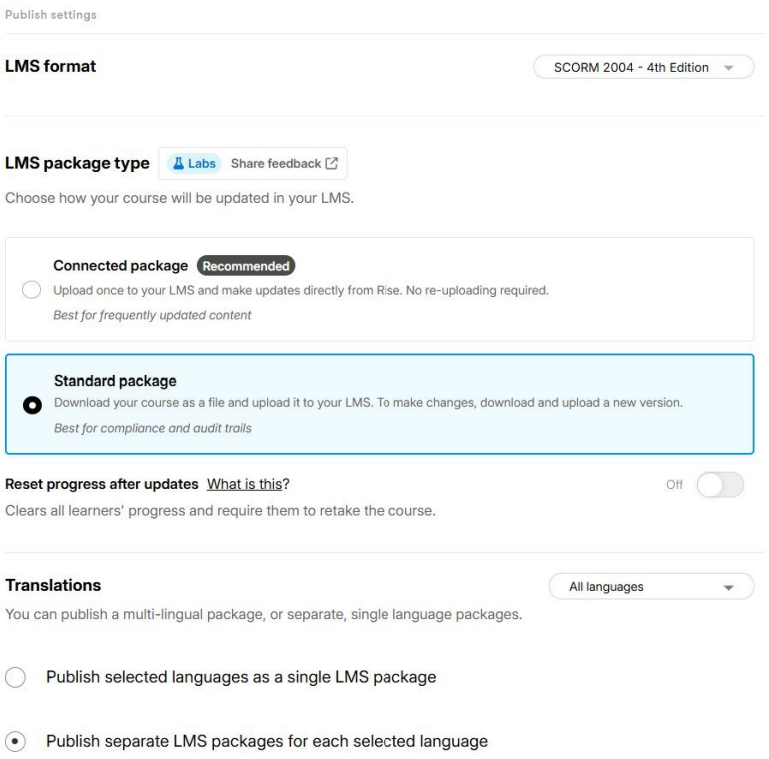

The packager combines the separate SCORM packages that Rise publishes for each language of a localized course into a single SCORM package. Learners choose their language when the course opens and can switch at any point using a dropdown above the course. Progress, bookmarks and completion are shared across languages.

It supports SCORM 1.2 and SCORM 2004 (all editions). The format is detected automatically from the packages you add.

> This tool requires that all language packages are published from the same Articulate Rise course using Articulate Localization. It runs entirely in your browser; no files are uploaded to any server and no internet connection is needed.

Step 1: Publish the language packages from Rise

1. In Publish settings, set **LMS package type** to **Standard package**.
2. Under **Translations**, select the languages and choose **Publish separate LMS packages for each selected language**.
3. Export and download the zip file. It contains one SCORM zip package per language; you do not need to unzip it.

Step 2: Merge the packages and upload to the LMS

1. Open **articulate-localization-multi-language-packager-v1.3.html** in your browser.
2. Drag and drop the downloaded zip file onto the drop area, or click it to upload. The tool extracts the language packages and detects the language, course and LMS format automatically. You can also add the individual language zip packages.
3. Review the Packages table and adjust the settings described below.
4. Click **Build and download merged package**. The merged zip downloads automatically; use **Download again** if your browser blocked it.
5. Upload the merged SCORM package to the LMS.

Settings

Setting	What it does
Order	Arrows set the order of languages in the dropdown.
Dropdown label	The name of the language as learners see it in the dropdown and in the first-launch language dialog.
Bar label	The text shown beside the dropdown (for example "Language:" or "Langue :"), per language.
Direction	LTR or RTL for the language bar. Right-to-left languages are detected automatically and can be overridden.
Position	Whether the dropdown sits at the top right or top left while that language is active.
Default	The language the course opens in before a learner has chosen one. The default package also provides the manifest and shared files.
Course title in the LMS	Optional. Replaces the title in the manifest and browser tab; leave blank to keep the default package's title.
Manifest identifier suffix	Text added to the end of the package's unique ID (its identifier in imsmanifest.xml). Because the merged package keeps the original course ID, some LMSs would otherwise treat it as an update of the single-language course. The suffix makes it a distinct course.
Keep the course resumable after completion	Off by default. When checked, the tool sets `scope.EXIT_SUSPEND_IF_COMPLETED = true` in scormdriver/driverOptions.js of the merged package.

Change log

Version 1.3

- New option **Keep the course resumable after completion** in the Options section, unchecked by default. It controls whether `scope.EXIT_SUSPEND_IF_COMPLETED = true` is added to scormdriver/driverOptions.js.
